A. Creating docker image using terraform Prerequisite:

1) Download and Install Docker Desktop from https://www.docker.com/ **Step 1:** Check the docker functionality

```
C:\Users\ADITYA DUBEY>docker
Usage: docker [OPTIONS] COMMAND
A self-sufficient runtime for containers
Common Commands:
   ommon Commands:
run Create and run a new container from an image
exec Execute a command in a running container
ps List containers
build Build an image from a Dockerfile
pull Download an image from a registry
push Upload an image to a registry
images List images
login Log in to a registry
logout Log out from a registry
search Search Docker Hub for images
version Show the Docker-wide information
info Display system-wide information
Management Commands:
    builder Manage builds
buildx* Docker Buildx
   checkpoint Manage Compose
compose* Docker Compose
container Manage containers
context Manage contexts
debug* Get a shell into any image or container
desktop* Docker Desktop commands (Alpha)
dev* Docker Dev Environments
Manages Docker extensions
might in your terminal
    checkpoint Manage checkpoints
    dev* Docker Dev Environments
extension* Manages Docker extensions
feedback* Provide feedback, right in your terminal!
image Manage images
init* Creates Docker-related starter files for your project
manifest Manage Docker image manifests and manifest lists
network Manage networks
plugin Manage plugins
                                   Manage plugins
     plugin
                                   View the packaged-based Software Bill Of Materials (SBOM) for an image
      scout*
                                   Docker Scout
     system Manage Docker
trust Manage trust on Docker images
Manage volumes
```

```
C:\Users\ADITYA DUBEY>docker --version
Docker version 27.0.3, build 7d4bcd8
```

Now, create a folder named 'Terraform Scripts' in which we save our different types of scripts which will be further used in this experiment.

Step 2: Firstly create a new folder named 'Docker' in the 'TerraformScripts' folder. Then create a new docker.tf file using Atom editor and write the followingcontents into it to create a Ubuntu Linux container.

```
Script:
#docker.tf

#docker.tf

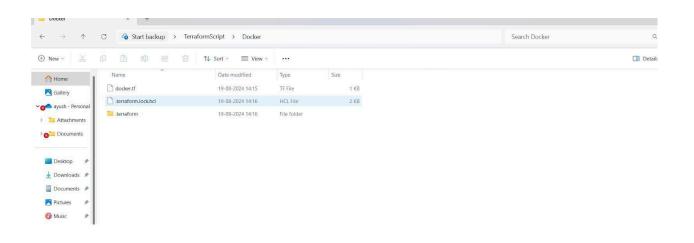

terraform {
  required_providers {
    docker = {
      source = "kreuzwerker/docker"
      version = "2.21.0"
    }
```

```
}

provider "docker" {
  host = "npipe:////./pipe/docker_engine" # For Windows
}

# Define the Docker image
resource "docker_image" "ubuntu" {
  name = "ubuntu:latest"
}

# Optional: Run a container from the image
resource "docker_container" "foo" {
  image = docker_image.ubuntu.image_id # Correct attribute
  name = "foo"
  command = ["sleep","infinity"]
}
```

```
⋈ Welcome
                       Docker > 🍟 docker.tf
PTS
               #docker.tf
               terraform {
ck.hcl
                 required_providers {
                   docker = {
                    source = "kreuzwerker/docker"
tate
                    version = "2.21.0"
tate.bac...
               provider "docker" {
               host = "npipe:///./pipe/docker_engine" # For Windows
               # Define the Docker image
               resource "docker_image" "ubuntu" {
               name = "ubuntu:latest"
               # Optional: Run a container from the image
               resource "docker_container" "foo" {
          22
                 image = docker_image.ubuntu.image_id # Correct attribute
                 name = "foo"
                 command = ["sleep","infinity"]
```

Step 3: Execute Terraform Init command to initialize the resources

```
C:\Users\ADITYA DUBEY\OneDrive\Desktop\terraformscripts\Docker>terraform init
Initializing the backend...
Initializing provider plugins...

- Finding kreuzwerker/docker versions matching "2.21.0"...

- Installing kreuzwerker/docker v2.21.0...

- Installed kreuzwerker/docker v2.21.0 (self-signed, key ID BD080C4571C6104C)
Partner and community providers are signed by their developers.
If you'd like to know more about provider signing, you can read about it here:
https://www.terraform.io/docs/cli/plugins/signing.html
Terraform has created a lock file .terraform.lock.hcl to record the provider
selections it made above. Include this file in your version control repository
so that Terraform can guarantee to make the same selections by default when
you run "terraform init" in the future.

Terraform has been successfully initialized!

You may now begin working with Terraform. Try running "terraform plan" to see
any changes that are required for your infrastructure. All Terraform commands
should now work.

If you ever set or change modules or backend configuration for Terraform,
rerun this command to reinitialize your working directory. If you forget, other
commands will detect it and remind you to do so if necessary.
```

Step 5: Execute Terraform apply to apply the configuration, which will automatically create and run the Ubuntu Linux container based on our configuration. Using command: "terraform apply"

Docker images, After Executing Apply step:

```
C:\Users\ADITYA DUBEY\OneDrive\Desktop\terraformscripts\Docker>docker images
REPOSITORY TAG IMAGE ID CREATED SIZE
ubuntu latest edbfe74c41f8 3 weeks ago 78.1MB
```

Step 6: Execute Terraform destroy to delete the configuration, which will automatically delete the Ubuntu Container.

```
- rm
- runtime = "runc" -> null
- suntime = "runc" -> null
- shm.size = 64 -> null
- shm.size = 64 -> null
- start = true -> null
- stdin_open = false -> null
- stdin_open = false -> null
- storage_opts = {} -> null
- tmpfs = {} -> null
- tmpfs = {} -> null
- tty = false -> null
- image_id = "sha256:edbef94c41f8a3501ce542e137cf28ea84dd03e6df8c9d66519b6ad761c2598awbuntu:latest" -> null
- latest = "sha256:edbef94c41f8a3501ce542e137cf28ea84dd03e6df8c9d66519b6ad761c2598aw -> null
- name = "ubuntuallatest" -> null
- name = "ubuntuallatest" -> null
- repo_digest = "ubuntuallatest" -> null
- repo_dige
```

Docker images After Executing Destroy step

```
C:\Users\ADITYA DUBEY\OneDrive\Desktop\terraformscripts\Docker>docker images
REPOSITORY TAG IMAGE ID CREATED SIZE

C:\Users\ADITYA DUBEY\OneDrive\Desktop\terraformscripts\Docker>docker images
```
